

Training sections are neighborhood shared and group community learning where plant life is nurtured, respected, and accounted for in mulching and other needs for waste regeneration. Green sections are also used for outside functions, and night time experiences restricted from wildlife abuse. The green barriers are split 50% responsible with each side unit as requirement for non fuel units. Canal must be kept clean, and canal zone cleared of excess growth. The removal of plants by pulling up by the roots can be used for an excess bury zones adjacent to canal where vegetation can be combined with waste type organic material. If excess occurs it is directed to training zones and additional nurturing of fruits and free vegetables.

The non fuel zones are self-sustaining once a season or two have been accomplished. Fruit trees and training zones will require a longer period to reach a group supportive level. These zones can only be built in particular latitudes where a certain amount of rain is falling in an average that is sustainable including sunshine amounts during all four seasons.

Estimates for latitudes:
